

AgriPro Brand Wheat Variety

AP Longjack

Hessian Fly Tolerant Awnless

Pedigree: D03-90-48 / Jackpot // Billings

Key Strengths

- » Awnless wheat variety for superior silage
- » Excellent Hessian fly tolerance
- » Excellent leaf and stripe rust tolerance

Call your AgriPro Associate® for local performance data and seed availability.

Agronomics

Type	Hard Red Winter
Head Type	Awnless
Seed Size	Large
Chaff Color	White
Herbicide Tolerance.....	None
Test Weight	Good
Straw Strength	Good
Relative Maturity.....	Medium
Plant Height.....	Medium
Winter Hardiness	Fair
Acid Soil Tolerance	Excellent
Coleoptile Length	Long
Tillering	Very Good
Milling & Baking Quality ...	Below Average
Protein	Fair

Ratings may vary across area of adaptation.

Disease and Pest Tolerance

Leaf Rust	Excellent
Stripe Rust.....	Excellent
Stem Rust.....	Very Good
Wheat Streak Mosaic Virus ..	Good
Barley Yellow Dwarf Virus.....	Good
Soil-Born Mosaic Virus.....	Good
Leaf Blotch	Excellent
Tan Spot	Excellent
Powdery Mildew	NA
Hessian Fly	Excellent
Fusarium Head Blight.....	Poor

Variety Protection

PVP..... Protected

Seed trading and resale by any unauthorized party is strictly prohibited by law.

Management Notes

AP Longjack is a medium maturity, awnless wheat, ideal for hay and silage systems. Grain yield is superior to other awnless wheats and may therefore be a good choice for producers wanting the hay/silage or grain option. Typical of awnless wheats, AP Longjack can be more difficult to thrash than awned types. This may warrant an adjustment to your combine's concave setting. Winter hardiness is well suited for the Southern Plains, but use caution north of Highway 50. AP Longjack is a top pick for growers battling Hessian fly.

Yield Data

Note: these agronomic assessments are updated annually by Syngenta scientists. The current values reflect each variety's relative performance within these characteristics through the 2024 crop year. Specific conditions may cause variations. These relative protection values are based on current pest and disease populations, known to shift periodically potentially changing specific evaluations. Resistance to many other diseases and pests is sensitive to environmental conditions, plant development stages and the presence and intensity of other diseases which may result in specific evaluation inconsistencies.
